

## **HSA SEWER PROJECT FAQs**

**Q:** Why do some residents in the Phase II project area have only 45 days to comply with the HSA water tightness regulations?

**A:** Some homeowners in the Phase II project area are on a 45 day timeframe for compliance because their sewer lateral tap was relocated during construction of the new sanitary sewer main. Relocated taps are installed at the homeowner's request, or when necessary due to connection issues identified in the field during construction. Most residents that receive relocated taps are required to connect to the new system within a certain timeframe because their building sewer remains tied into the existing sewer until the homeowner's new private side lateral is constructed and connected to the relocated taps. This timeframe is necessary because the HSA's contractor is responsible for conversion of the old sanitary sewer system into a groundwater removal system, and this conversion cannot be completed with the existing sewer lateral connected to the old system.

**Q:** What is Infiltration and Inflow (I/I)?

**A:** Infiltration is groundwater, or, groundwater that is influenced by surface water, which enters sewer pipes (interceptors, collectors, manholes, or side sewers) through holes, breaks, joint failures, connection failures and other openings. Infiltration quantities often exhibit seasonal variation in response to groundwater levels. Storm events can trigger a rise in groundwater levels and increase infiltration flows. The highest infiltration flows are observed following significant storm events or following prolonged periods of precipitation.

Inflow is surface water that enters the wastewater system from yard, roof and footing drains, from cross-connections with storm drains, downspouts and sump pumps. Inflow occurs as a result of storm events such as rainfall, snowfall, springs or snow melt that contribute to excessive sewer flows. Peak inflow can occur during heavy storm events when storm sewer systems are surcharged, resulting in hydraulic backups and local ponding. Inflow and infiltration is clear water that enters the sanitary sewer system from a variety of sources.

Infiltration occurs when groundwater seeps into sewer pipes through cracks, leaky pipe joints and/or deteriorated manholes.

Inflow, occurs in direct proportion to the amount of rainfall. Inflow is storm water that enters the wastewater system through rain leaders, basement sump pumps or foundation drains illegally connected directly to a sanitary sewer pipe.

Q: Why is I/I a problem?

A: I/I ends up at the regional wastewater treatment plant, where it must be treated like sewage, resulting in higher treatment costs.

I/I often requires new and larger wastewater treatment facilities, conveyance systems or holding tanks to convey, store and treat larger volumes of flow. This additional infrastructure results in higher capital expenditures.

I/I flows contribute to sewer system surcharging into local homes and overflows into the region's waterways (CSOs), negatively impacting public health and the environment. It is estimated that inflow and infiltration make up 85 percent of peak flows during winter and rain events and as much as 70 percent of this peak flow comes from privately owned sewer networks.

Protecting the environment and decreasing wastewater treatment costs are the benefit of a responsible I/I control program.

Q: Why has the HSA decided to only replace certain sections of the sanitary sewer mains?

A: Phase I of the Sanitary Sewer Improvements Project was initiated as part of the HSA's mandated corrective action plan (CAP) for the M2 sub-basin (Legion Park Interceptor). Later, corrective action was mandated in the M11 sub-basin to address surcharging concerns in the East Fir Street area. These two CAPs were later combined into the M2/M11 Cap Plan and make up the Phase I project area.

Phase II was possible due to surplus PENNVEST monies secured by the HSA to fund the Phase I project. The Jones Street area sub-basin was selected as the focus area for the Phase II project due to its aged infrastructure, significant I/I contribution and connection to the Jones Street CSO.

Q: Why are only some portions of the Borough required to comply with the HSA's water tightness regulations?

A: HSA regulations require that:

At the completion of all HSA mainline sewer replacement projects, all residential homes which have been provided sanitary sewer service by the Authority, must successfully pass an air or water pressure test.

Therefore, only those homes that are part of the sewer replacement project areas described above are required to meet the HSA water tightness regulations at this time.

Q: Will all of the larger public buildings in the project areas, such as the HASD buildings, churches and YMCA required to comply with the HSA water tightness regulations?

A: Yes.

All buildings – residential, commercial and industrial – located within the project areas and connected to the HSA's new sanitary sewer main will be required to comply with the HSA's water tightness regulations. Compliance requirements for residential and commercial/industrial properties are addressed in §1703 of the HSA rules and regulations.

Q: Are there financing/funding options available to assist homeowners with the costs associated with meeting compliance with the HSA's watertightness regulations?

A: Yes, there are financing/funding options available from the following institutions:

Institution:

S&T Bank  
1100 Logan Boulevard, Altoona, PA  
814-941-1080  
[stbank.com/hollidaysburgproject](http://stbank.com/hollidaysburgproject)

Program Details:

Unsecured loan, minimum amount of \$2,000. APR starting @ 5.75%. Loan term based on amount borrowed. Loan to be used for the Hollidaysburg sewer line project.

Institution:

PHFA/PENNVEST  
855-827-3466  
[www.phfa.org/programs/repairs.aspx](http://www.phfa.org/programs/repairs.aspx)

Program Details:

Secured loan (up to \$25,000). Up to 20 years at a fixed interest rate currently as low as 1.75%. No prepayment penalty if the loan is paid off early. Funds may be used for design charges, construction fees and costs, inspection and permit fees, and most loan origination fees.

Q: How exactly is pressure testing done? What needs to be tested?

A: The system to be tested must first be isolated. This is done by installing a plug at each opening and connection to the building sewer (as illustrated in Figure 1). The system is then pressurized with compressed air. All buried piping, including under-slab piping, must be tested from the home to the property line. In order for the system to pass the pressure test and meet compliance with the HSA's watertightness regulations, the system must hold five (5) psi for 15 minutes.

Typical test points are as follows:

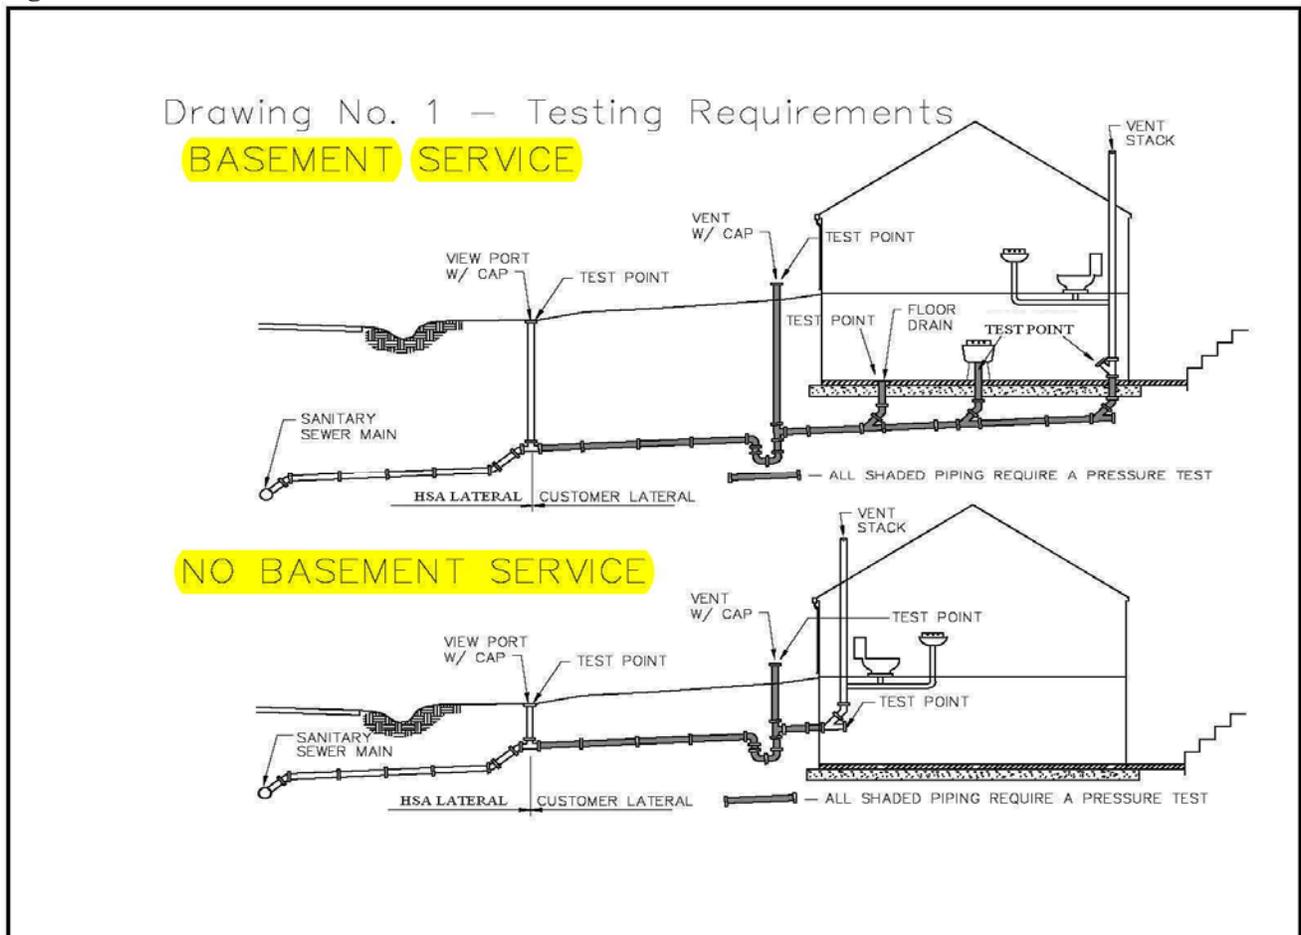

**Home with Basement Service (Figure 1):**

- View Port at HSA/Customer lateral transition
- Vent assembly
- Floor drains, sink drains and toilet assemblies (at or near floor level).
- Main sewer/vent stack (at or near floor level).

**Home with without Basement Service (Figure 1):**

- View Port at HSA/Customer lateral transition
- Vent assembly
- Building sewer at foundation wall

Figure 1

Q: Will the HSA Sanitary Sewer Improvements project reduce infiltration and inflow (I&I) in the sanitary system? Will the project reduce surcharge risks (i.e. sewer backups)?

A: Yes. The completion of the public sector sanitary sewer work by the HSA, coupled with property owner compliance with the Authority's rules and regulations, will significantly reduce I&I into the system, and therefore, reduce the risk of system surcharging.

Posted 11/21/2017

Q: How many residents/customers are affected by the HSA's Sanitary Sewer Improvements Project?

A: In the Phase I project area, 466 residents and 2 commercial/industrial customers are affected. In the Phase II project area, 195 residents and 0 commercial/industrial customers are affected.

Posted 11/27/2017

Q: Is it possible to get a map of the Phase I project area that includes the points/locations where the contributing municipalities connect to the Hollidaysburg system?

A: Yes. A complete, pre-construction sewer system map, entitled "Pre-Construction Sanitary Sewer System Map – Hollidaysburg Borough" is available on the Borough's website. A printed full-size version of the map is also available at the Borough building for review.

Q: Why was the public not given the option of signing an easement and subsequent Hold Harmless Agreement so that the HSA could install private side-sewer laterals? Why was it "assumed" that the residents of Phase I would not sign a Hold Harmless Agreement? Were the residents of Phase I ever given a choice?

A: The Authority decided not to include the laterals from the property line to the building foundation in the public sector project because PennVEST would require the Authority to own and maintain the private laterals for the life of the PennVEST loan.

Q: Approximately how much of the \$6,000,000 of Pennvest granted money was originally estimated and slated for to rehabilitate the resident sewer lateral of Phase I?

A: The bid for the Phase I project included 12,000 feet of sanitary sewer lateral piping. The Contractor bid \$43 per foot, so \$516,000 of the \$4,624,290 bid was for laterals. This lateral item was used to pay the Contractor to install lateral piping from the new sewer main to the property line for each connection. The Phase I contractor installed 11,610 feet of lateral piping. Therefore, 390 feet of the lateral item was not utilized. At a contract unit price of \$43 per foot, the Authority saved \$16,770.

Q: Why was \$1.7 million diverted to Phase II when Phase I was the “highest priority” as determined by the Sewer System Evaluation Study (SSES) prepared by Gannett Fleming in 2000-2001?

A: The PennVEST budget and funding offer included \$6,000,000 for construction. The budget and funding offer also included a contingency amount of \$295,000. The low bid for the phase I project was \$4,624,290 leaving a surplus of \$1,670,710 in construction funds. The Authority had to decide whether they wanted to petition PennVEST through a change of scope to keep the money for another project or turn the money back at the time of closing. The Authority was advised by their Engineer that the worst case scenario is 100% of any money turned back to PennVEST would be grant money or best case scenario the Authority would turn back the pro-rated amount of grant money. The Authority decided they would rather petition PennVEST through a change of scope to keep all of the construction money rather than turn back any grant dollars. A change of scope was presented to PennVEST to incorporate the Phase II project into the funding package. PennVEST approved the Authority’s request so \$1,670,710 was allocated for the Phase II project.
